beanpay

提供钱包帐户的创建、查询,余额加款、扣款、退款、查询功能 提供服务包创建、查询,数量增加、减少、撤销、查询功能

- √ 支持钱包余额的加、扣、退
- √ 支持服务包数量的增、减、撤
- √ 独立服务运行,调用 api,rpc 服务集成
- √ 集成服务运行,使用源代码直接集成
- √ 高并发支持
- √ 基于 hydra 构建

接口开发规范

一、独立服务

独立启动 apiserver 对外提供 api, rpc 服务

1、启动 apiserver

- 编译 apiserver 服务
- ~/work/bin\$ go install -tags "prod" github.com/micro-plat/beanpay/apiserver #mysql 或
- ~/work/bin\$ go install -tags "prod oci" github.com/micro-plat/beanpay/apiserver #oracle
- 安装服务, 根据向导设置数据库连接串, 生成数据库表结构
- apiserver install -r zk://192.168.106.18 -c t
- 启动服务

2、测试服务

• 传入用户编号、名称创建钱包帐户。返回创建好的帐户信息

```
~/work/bin$ curl "http://192.168.4.121:9090/account/create?sid=oms&eid=86001&name=colin& {"account_id":86000, "account_name":"colin", "account_type":"1", "balance":200, "credit":0}
```

• 传入用户编号或商户编号,外部交易编号(幂等判断),加款金额进行钱包加款。返回加款记录信息

```
~/work/bin$ curl "http://192.168.4.121:9090/account/balance/add?sid=oms&eid=86001&trade_{account_id":"86000","amount":"200","balance":"200","change_type":"1","create_time":"200","balance":"200","change_type":"1","create_time":"200","balance":"200","change_type":"1","create_time":"200","balance":"200","balance":"200","change_type":"1","create_time":"200","balance":"200","balance":"200","balance":"200","change_type":"1","create_time":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","balance":"200","bal
```

• 传入用户编号或商户编号,外部交易编号(幂等判断),加款金额进行钱包扣款。返回扣款记录信息

```
~/work/bin$ curl "http://192.168.4.121:9090/account/balance/deduct?sid=oms&eid=86001&tra{"account_id":"86000","amount":"-200","balance":"0","change_type":"2","create_time":"201
```

传入用户编号、外部扣款交易编号(幂等判断),退款金额进行钱包退款,退款金额不能大于扣款金额,同一笔扣款只允许一次退款操作。返回退款记录信息

```
~/work/bin$ curl "http://192.168.4.121:9090/account/balance/refund?sid=oms&eid=86001&tra{ "account_id":"86000", "amount":"200", "balance":"200", "change_type":"3", "create_time":"20
```

其它接口,参考开发规范

二、代码集成

将数据表创建到业务系统,或独立库,业务系统使用本地代码,直接进行帐户、服务包操作

1、创建数据库

使用 beanpay 创建数据库,支持 mysql, oracle

编译 beanpay

```
~/work/bin$ go install github.com/micro-plat/beanpay #mysql
或
~/work/bin$ go install -tags "oci" github.com/micro-plat/beanpay # oracle
```

• 创建数据表

beanpay [注册中心地址] [平台名称] 即可将 beanpay 需要的表创建到 /平台/var/db/db 配置的数据库中。

```
~/work/bin$ beanpay zk://192.168.0.109 mall #读取/mall/var/db/db 创建数据库
或
~/work/bin$ beanpay zk://192.168.0.109 mall mdb #读取 /mall/var/db/mdb 创建数据库
```

2、编码

• 创建帐户

```
bp:=beanpay.NewBeanpay("oms","0")//根据系统编号与帐户类型创建支付对象
account, err := bp.CreateAccount(ctx,
               ctx.Request.GetString("eid"),
               ctx.Request.GetString("name"))
if err != nil {
    return err
}
return account
• 帐户加款
bp:=beanpay.NewBeanpay("oms","0")
record, err := bp.AddAmount(ctx,
               ctx.Request.GetString("eid"),
               ctx.Request.GetString("trade_no"),
               ctx.Request.GetInt("amount"))
if err != nil {
    return err
return record
```

• 帐户扣款

其它操作请查看http://github.com/micro-plat/beanpay/beanpay/service.go
